- 10** End-to-End Test Checklist

1. Getting Started & Roles

1.1 What is the system?

Kitchen & Bakery Management System is an all-in-one web application for running a bakery and kitchen business. It combines point-of-sale checkout, product and recipe management, ingredient inventory, a formal production-request workflow between kitchen and bakery, order history, expenses, and financial reports in one clean interface.

1.2 Demo accounts

Role	Department	Email	Password
Admin	All areas	admin@example.com	password
Cashier	Sales	cashier@example.com	password
Staff	Bakery	staff@example.com	password
Staff	Kitchen	kitchen@example.com	password

1.3 How role permissions work

The sidebar adapts to the logged-in user. Each role only sees the pages it is allowed to use:

Area	Admin	Cashier	Bakery	Kitchen
Dashboard	Yes	Yes (sales only)	Yes (stock)	Yes (stock)
Sell / POS	Yes	Yes	-	-
Orders	Yes	Yes	-	-
Customers	Yes	Yes	-	-
Products / Recipes	Yes	-	Yes	-
Production batches	Yes	-	Yes	-
Ingredients / Suppliers	Yes	-	-	Yes
Production requests	Yes	-	Yes	Yes
Reports / Expenses / Users / Settings	Yes	-	-	-

1.4 Login

- >>Open the app in a browser (demo URL in the app environment).
- >>Enter the email and password from the table above and press the Sign in button.
- >>You land on the role-specific Dashboard.

2. Administrator (Admin)

The admin sees everything. Use the sidebar to navigate.

2.1 Dashboard

The admin dashboard shows Today's Sales, This Week's Sales, Today's Batches, plus weekly sales trend, sales-vs-expenses, and payment-method charts, along with top products and recent orders.

2.2 What admins manage

- Users - create and manage staff accounts and roles from the Users page.
- Reports - full financial analytics over a custom date range, with CSV export of orders.
- Expenses - record rent, utilities, wages, ingredients and other business costs.
- Settings - upload the company logo, set the company name, and add Paystack keys for online payments.
- Every operational area (POS, products, ingredients, requests, orders) - admin can access all of them.

3. Cashier - Point of Sale (Sell / POS)

3.1 Build a sale

- >>Open Sell / POS from the sidebar.
- >>Tap a product card (or search / select a category) to add it to the cart.
- >>Tap +/- on a cart line to change quantity, or press Remove to drop a line.
- >>Optionally press Discount to apply a discount to the sale.

3.2 Customer, payment, and checkout

- >>Pick a saved customer or type a new customer name.
- >>Choose a payment method: Cash, Card, Bank Transfer, or Online (Paystack, if keys are set).
- >>Press Checkout to complete the sale. A printable receipt opens automatically.
- >>The receipt can be printed or saved as a PDF from the browser.

3.3 Hold and resume

- >>Press Hold to set a sale aside.
- >>On the right, press Resume to bring a held sale back into the cart, or Discard to delete it.

Stock is deducted at checkout for each sold product. Online payments create a pending order and deduct stock only after Paystack confirms the payment.

4. Cashier - Orders, Refunds & Customers

4.1 Order history

- >>Open Orders from the sidebar to see the full order history.
- >>Open any order to view its items, totals, payment method, and receipt.
- >>Use Export (CSV) to download the order list.

4.2 Refund an order

- >>Open the order you want to refund.
- >>Press Refund. The refund is recorded and product stock is restored automatically.

Refunds restore stock, so inventory stays accurate after a return.

4.3 Customers

- >>Open Customers to create and manage customers (name and contact details).
- >>Each customer page shows their order history, total spent, and average order value.
- >>At the POS, select a saved customer so the sale is attached to them.

5. Kitchen Staff - Ingredients & Suppliers

5.1 Ingredients

- >>Open Ingredients to see every raw material: stock level, unit, cost per unit, stock value, and low-stock threshold.
- >>Open an ingredient to view its full movement history (purchases, usage, issuance, adjustments).

5.2 Receive stock (purchases)

- >>On an ingredient, press Add Purchase / Receive Stock.
- >>Enter the quantity and new unit cost (and select the supplier if applicable).
- >>Save - stock is increased and the unit cost is updated with a logged stock movement.

5.3 Adjust stock

- >>Use Adjust Stock to correct counts (e.g., spoilage or stock-take differences).
- >>Choose whether to add or subtract and record a reason - every adjustment is audited.

5.4 Suppliers

- >>Open Suppliers to manage the businesses you buy raw materials from (name and contact details).

6. Bakery Staff - Products, Recipes & Production

6.1 Products

- >>Open Products to manage finished goods: name, category, selling price, estimated cost, and stock.
- >>Use the toggle to activate / hide a product from the POS.

6.2 Recipes (bill of materials)

- >>Open a product and edit its Recipe.
- >>Add one or more ingredients with the quantity each finished unit needs.
- >>Save - the product's estimated cost is recalculated automatically from the recipe.

6.3 Production batches

- >>Open Production to record a finished batch.
- >>Select the product and enter the batch size; the required ingredients are calculated from the recipe.
- >>Record finished units, plus wastage / rejected units, and save.

Production requests control the actual issue of ingredients - see Section 7.

7. Production Request Workflow

This is the heart of the kitchen-bakery handoff. Raw materials only leave the store with an approved request and a stock movement record.

7.1 The lifecycle

Stage	Who	What happens
Draft	Bakery	Request for a product and batch size; ingredients auto-calculated
Submitted	Bakery	Sent to the kitchen for review
Approved / Rejected	Kitchen	Ingredient list reviewed, then approved or rejected
Issued	Kitchen	Ingredients released; stock deducted with a logged movement
Produced	Bakery	Finished batch recorded (incl. wastage / rejected units)
Cancelled	Either	Request cancelled before any issuance

7.2 Walkthrough

- >>Bakery: create a production request, choose a product and batch size, then Submit.
- >>Kitchen: open the request, review the ingredient list, press Approve.
- >>Kitchen: press Issue to release the ingredients - stock is deducted automatically.
- >>Bakery: open the request and press Produce, enter finished / wastage units, and save.
- >>Admin / both: the request timeline shows every action with the user who performed it.

A request that does not match available stock can still be submitted - the kitchen decides at approval.

8. Reports & Analytics (Admin)

8.1 Date-range report

- >>Open Reports from the sidebar.
- >>Pick a From and To date, then press Generate.
- >>The header cards show: Sales, Orders, Discounts given, Units produced, Expenses, Tax collected, Production cost, and Net profit.

8.2 Detail sections

- Daily Sales - orders and totals per day in the period.
- Payments by Method - cash / card / transfer / online breakdown.
- Top Products - best sellers by revenue and quantity.
- Most Used Ingredients - ingredient consumption across production in the period.
- Production History - batches completed in the period.
- Inventory Value - total value of product and ingredient stock.

8.3 Export

- >>Press Export orders (CSV) to download all orders in the selected range as a spreadsheet file.

9. Company Settings, Users & Payments

9.1 Settings

>>Open Settings (admin only).

>>Upload the company logo and set the company name - they appear in the sidebar and on the login page.

>>Optionally add Paystack Public and Secret keys to enable Online payment at the POS.

Never share your Paystack secret key. It is stored in your environment / settings for server-side use only.

9.2 Users

>>Open Users to manage staff accounts.

>>Create a user with an email, name, and role (Admin, Cashier, or Staff).

>>The first registered user in a fresh install automatically becomes the Admin.

9.3 Profile

>>Use the avatar menu > Profile to update your name/email and change your password.

10. End-to-End Test Checklist

Run the checklist below top-to-bottom to verify the entire system. Tick each item when it passes.

10.1 Authentication

- Login works for all four demo accounts (admin, cashier, bakery staff, kitchen staff).
- Wrong credentials show a validation error and stay on the login page.
- Logout returns to the login page and protected pages redirect there when unauthenticated.

10.2 Role isolation

- Cashier cannot see Products, Ingredients, Reports, or Users.
- Bakery cannot see Ingredients or Reports; Kitchen cannot see Products or Reports.
- Reports / Expenses / Users / Settings are visible only to Admin.
- Directly visiting a forbidden URL redirects away or is denied.

10.3 POS & sales

- Add, remove, and re-quantify cart lines.
- Hold a sale, resume it, and discard it.
- Complete a cash sale with a printed receipt; stock decreases by the sold quantities.
- Complete an Online (Paystack) sale in test mode; order is pending and stock only moves after payment confirmation.
- Attach a saved customer to a sale and see it on the customer's history.

10.4 Orders, refunds & customers

- Order list and order detail pages show correct totals and payment method.
- Refund restores product stock and the refund is visible on the order.
- CSV order export opens a valid spreadsheet.

10.5 Inventory & production

- Receive stock increases ingredient quantity and updates unit cost with a movement record.
- Adjust stock records a reason and an audited movement.
- Creating a production request auto-calculates ingredients from the recipe.
- Approving then Issuing a request deducts ingredient stock exactly once.
- Recording production adds finished product stock and logs wastage.
- Cancelling a request before issuance leaves stock untouched.

10.6 Reporting

KITCHEN & BAKERY MANAGEMENT SYSTEM

- Changing the date range updates every card and detail section.
- Net profit = sales - discounts - expenses - production cost + tax adjustments.
- CSV export honours the selected date range.

10.7 Settings & users

- Company name and logo updates appear in the sidebar and on the login page.
- Creating a user with a new role changes that user's sidebar on next login.

This guide covers the demo environment seeded with sample data. In production, use real credentials and your own Paystack keys.
